William Christian Kolega

Tampa, FL • +1 (656) 221-5249 • billkolega@outlook.com

PROFESSIONAL SUMMARY

Full-stack engineer with 10 years of software development experience across enterprise platforms and AI-enabled tools. Architected Go and gRPC services, shipped React interfaces, and improved LLM-assisted workflows with guarded tool integrations and measurable latency reductions. Drives architecture decisions across distributed engineering teams.

TECHNICAL SKILLS

Core Languages: Go | Python | TypeScript | JavaScript | SQL

Frontend & Visualization: React | TSX | HTML/CSS | AngularJS | Vega-Lite

AI & Agent Systems: Large Language Models (LLMs) | Google Agent Development Kit (ADK) | Model Context Protocol (MCP) | Agent2Agent (A2A) | Retrieval-Augmented Generation (RAG)

Backend Architecture: gRPC | Protocol Buffers | REST APIs | Java | Microservices

Deployment & Quality: Kubernetes | CI/CD | DevOps | Schema Validation | Performance Optimization

Distributed Engineering: Architecture Reviews | Distributed Collaboration | Cross-Functional Delivery | Reliability Ownership | Technical Documentation

PROFESSIONAL EXPERIENCE

Sourcegraph

San Francisco, CA (Remote)

Senior Full Stack AI Engineer

01/2023 – 09/2026

- Architected Go-based repository indexing services behind gRPC endpoints, using Protocol Buffers for versioned contracts and bounded work queues to handle 3.2 million daily requests while **bringing p95 response time from 420 to 290 milliseconds**.
- Drove a React and TSX overhaul of code-search analytics views, introducing incremental rendering and reusable query-state components for 11 high-traffic screens; reduced interaction latency by 28% and clarified navigation for enterprise users.
- Engineered a Python service for LLM-assisted code explanations, pairing retrieval-augmented generation (RAG) with schema validation and replayable failure cases across repository-scoped contexts; **cut unsupported-answer escalations by 24%** without widening read permissions.
- Evaluated Google Agent Development Kit (ADK) for bounded multi-step developer workflows, defining tool permissions, execution traces, and manual approval checkpoints; documented architecture review criteria so internal agent prototypes could be tested without exposing privileged write operations.
- Introduced Model Context Protocol (MCP) adapters around repository search and file navigation for external agent clients, using capability-scoped tokens and structured error responses; **reduced failed agent tool calls from 7.1% to 2.4%** in test traffic.
- Prototyped Agent2Agent (A2A) handoffs between code-navigation and review assistants, establishing task identifiers, cancellation semantics, and auditable responses across service boundaries; focused on failure containment rather than fully autonomous change approval to keep runs inspectable.
- Overhauled Kubernetes delivery and CI/CD checks for API and agent components, adding canary gates and rollback playbooks; **reduced failed production deployments from 8% to 3%** while standardizing releases across distributed engineering teams.

Grafana Labs

New York, NY (Remote)

Full Stack Software Engineer

06/2020 – 12/2022

- Owned a Go query-adapter service for enterprise telemetry dashboards, tightening SQL time-window filters and controlling concurrent reads across data sources; **cut median dashboard query time from 1.1 seconds to 720 milliseconds**.
- Rebuilt AngularJS panel extensions as React and TypeScript plugins, preserving data-source contracts while lazily loading visual elements and retaining keyboard navigation; **reduced dashboard initialization from 3.8 to 2.6 seconds** for migrated panels.
- Shipped Vega-Lite exploration panels for incident trend analysis, converting backend aggregates into reusable chart specifications with drill-down filters, sensible sampling limits, and safe defaults that made dense multi-series telemetry easier to interpret.
- Implemented REST API endpoints and typed configuration migration paths for enterprise dashboards, adding schema validation and integration tests; lowered malformed-query errors by 37% across affected plugins.
- Partnered with design and support engineers across time zones to simplify JavaScript and HTML/CSS plugin settings, documenting edge cases and ensuring accessible controls remained consistent with existing user workflows.

Dell Technologies

Overland Park, KS (Onsite)

Software Engineer

06/2016 – 05/2020

- Implemented Java and SQL-backed inventory reconciliation workers for enterprise support systems, batching updates and adding duplicate guards to cut nightly processing from 5.5 hours to 3.4 hours.
- Developed Python automation around REST API integration checks and retry-safe ticket updates, replacing manual spreadsheet comparisons with repeatable validation so support teams could trace failed device status syncs.
- Instrumented service logs and queue-depth alerts for hardware entitlement feeds, separating transient downstream timeouts from bad records and lowering mean incident diagnosis time from 65 to 38 minutes.
- Refactored authentication and payload-validation logic in internal backend services, working within senior-reviewed designs and documenting failure paths to make upstream integration changes safer to deploy.

EDUCATION

The University of Kansas, Bachelor of Science (B.S.), Computer Science 2012 – 2016
